1 Have you...

1.1 tried...

- Reading the problem once more?
- doubting "obvious" things?
- writing obivous things?
- radical greedy approach?
- thinking in reverse direction?
- a greedy algorithm?
- network flow when your greedy algorithms stuck?
- a dynamic programming?
- checking the range of answer?
- random algorithm?
- graph modeling using states?
- inverting state only on odd indexes?
- calculating error bound on a real number usage?

1.2 checked...

- you have read the statement correctly?
- typo copying the team note?
- $\bullet\,$ initialization on multiple test case problem?
- additional information from the problem?
- undefined behavior?
- overflow?
- function without return value?
- real number error?
- $\bullet \ \ implicit \ conversion?$
- comparison between signed and unsigned integer?

2 Algorithmic Idea Note

- I. Complete Search: Backtracking & Pruning
- II. Math
 - A. Number Theory
 - 1. Prime Number
 - i) Sieve of Eratosthenes, Prime Factorization
 - ii) Fast Prime Verdict; Millar-Rabin
 - iii) Fast Prime Factorization; Pollad Rho
 - 2. Extended Euclidean Algorithm; Diophantos Equation
 - 3. Chinese Remainder Theorem
 - 4. Harmonic Lemma
 - 5. Floor Sum (Sum of Rational Arithmetic Sequence)
 - 6. Several Sieves
 - B. Linear Programming
 - 1. Solve (some) LP with Shortest Path
 - C. FFT & Polynomials
 - 1. FFT: Convolution
 - i) High precision FFT with modulo 1e9+7
 - 2. NTT: Number Theoretic Tranform
 - 3. Quotient Ring (Formal Power Series)
 - i) Multiplication
 - ii) FPS: Inverse / Division
 - iii) Integration / Differentiation
 - iv) FPS: Logarithm / Exponentiation
 - v) FPS: Power of Polynomial
 - vi) Division Quotient & Remainder
 - vii) Polynomial Taylor Shift
 - viii) Multipoint Evaluation
 - D. Combinatorics
 - 1. Labeled Combinatorial Target
 - 2. The Twelvefold Way (12정도)
 - 3. Generating Function
- III. Linear Algebra
- IV. Geometry
 - A. Basic Tools
 - 1. Outer Product (CCW)
 - 2. Sorting by Polar
 - 3. Segment Intersection
 - 4. Closest Point
 - 5. Furthest Point
 - B. Convex Polygon (Convex Hull)
 - 1. Convex Hull Construction
 - 2. Convex Layer
 - 3. Rotating Calipers
 - 4. Point Containment
 - 5. Tangent to convex polygon
 - 6. Inner and Outer Tangent of two Convex's
 - C. General Polygon
 - D. Half Plane Intersection
 - E. Delaunay Triangulation : Voronoi diagram
- V. Greedy
 - A. Rearrangement Inequality
- VI. DP

                            using vl = vector<ll>;
using vii = vector<pii>;
                            using vll = vector<pll>;
```

3 Math

3.1 Prime Number

3.1.1 Distribution of Prime Number

1e2	25	1e6	78,498	1e10	<5e8
1e3	168	1e7	664,579	1e11	<5e9
1e4	1,229	1e8	<6e6	1e12	<4e10
1e5	9,592	1e9	<6e7	1e13	<4e11

3.1.2 Prime Gap

```
2 \cdot 10^5 이하의 소수 간극 \leq 100 2^{32} 이하의 소수 간극 \leq 464 2^{64} 이하의 소수 간극 \leq 1550
```

3.2 Miller-Rabin Algorithm

Usage: $is_p(X)$: returns true if X is prime, otherwise false.

```
When X \leq 2^{32}, D = \{2,7,61\} is sufficient; X \leq 2^{64}, D = \{p|p \text{ is prime}, p \leq 37\} \text{ is sufficient}.
```

```
Time Complexity: O(log<sup>3</sup> X)
ll pow(ll a, ll b, ll mod)
{
    ll ret = 1;
    for(int st=0; (1LL<<st) <= b; st++)
    {
        if((1LL<<st) & b) ret=(lll)ret*a%mod;
        a=(lll)a*a%mod;</pre>
```

```
}
    return ret;
}
bool miller(ll n, ll a)
{
    if(n == a) return true;
    11 x = n-1;
    if(pow(a, x, n) != 1) return false;
    while(x\%2==0)
        x/=2;
        ll t = pow(a, x, n);
        if(t!=1 and t!=n-1) return false;
        if(t==n-1) return true;
    return true;
}
bool is_p(ll n)
    if(n<=2) return n==2;
    vi D = {2, 3, 5, 7, 11, 13, 17, 23, 29, 31, 37};
    for(auto i:D) if(!miller(n, i)) return false;
    return true;
}
3.3 Pollad Rho Algorithm
  Usage: po_rho(N): returns array of prime factors of X.
  Time Complexity: \mathcal{O}(N^{1/4})
void fact(ll n, vl& ret)
    if(n == 1) return;
    if(n\%2 == 0)
        ret.pb(2);
        fact(n/2, ret);
        return;
    }
    if(is_p(n))
        ret.pb(n);
        return;
    11 a, b, c, g = n;
    auto f = [\&c, \&n](11 x)->11{return (c+(111)x*x)%n;};
    do
        if (g == n) a=b=rand()%(n-2)+2, c=rand()%20+1;
        a=f(a); b=f(f(b));
        g = gcd(a-b, n);
    \}while(g == 1);
    fact(g, ret); fact(n/g, ret);
}
vl po_rho(ll n)
    vl ret;
    fact(n, ret);
    sort(all(ret));
    return ret;
}
```

POSTECH – ConForza Page 5 of 20

3.4 Diopantos Equation(Extended Euclidian Algorithm)

```
Usage: diophantos(a, b) : return one integer solution of ax + by = 1, satisfying 0 \le x < b.
```

```
Time Complexity: O(log(max(a,b)))
pll diophantos(ll a, ll b)
{
    assert(a>0 and b>=0);
    if(b == 0) return {1, 0};
    auto [y, x] = diophantos(b, a%b); y = y-(a/b)*x;
    if(x < 0 or x >= b)
    {
        ll t = x/b;
        if(x%b < 0) t--;
        x -= b*t; y += a*t;
    }
    return {x, y};
}</pre>
```

3.5 Chinese Remainder Theorem

Usage: $\mathtt{crt}(\mathtt{pll}\ \mathtt{p},\ \mathtt{pll}\ \mathtt{q})$: return $\mathtt{pll}\ \mathtt{r},\ \mathrm{satisfying}$ follows:

```
x \equiv p.fi \mod p.se
and x \equiv q.fi \mod q.se
\leftrightarrow x \equiv r.fi \mod r.se
```

```
If there's no such r, return {-1,-1}.
    Time Complexity: O(log A)
pll crt(pll p, pll q)
{
    if(p.fi > q.fi) swap(p, q);
    auto [a, A] = p;
    auto [b, B] = q;

    ll g = gcd(A, B);
    if((b-a)%g != 0) return {-1, -1};

    ll i = A, j = B, k = b-a;
    i/=g; j/=g; k/=g;
    auto [x, y] = diophantos(i, j);
    return {(ll)((a+(lll)A*k*x)%(A*B/g)), A*B/g};
}
```

3.6 Harmonic Lemma

Usage: f(N): return the value

$$\sum_{i=1}^{N} \left\lfloor \frac{N}{i} \right\rfloor = \left\lfloor \frac{N}{1} \right\rfloor + \left\lfloor \frac{N}{2} \right\rfloor + \dots + \left\lfloor \frac{N}{N} \right\rfloor$$

Time Complexity: $\mathcal{O}(\sqrt{N})$

```
11 f(int n)
{
    11 ans = 0;
    for(int i = 1; i <= n; i = n/(n/i)+ 1)
        ans += (11)(n/(n/i)-i+1)*(n/i);
    return ans;
}</pre>
```

3.7 Floor Sum (Sum of Floor of Ratinoal Arithmetic Sequence)

Usage: floor_sum(A, B, C, N): retun the value

$$\sum_{x=1}^{N} \left\lfloor \frac{Ax + B}{C} \right\rfloor$$

```
Time Complexity: O(log N)
11 floor_sum(11 a, 11 b, 11 c, 11 n)
{
    if(a>=c or b>=c) return n*(n-1)/2 * (a/c) + n * (b/c) +
    floor_sum(a%c, b%c, c, n);
    if(a == 0) return b/c*n;

    ll m = (a*(n-1)+b)/c;
    return m*(n-1) - floor_sum(c, c-b-1, a, m);
}
```

3.8 FFT - Convolution

}

 $11 \mod = 1e9+7;$

```
Time Complexity: O(N \log N)
using cpx = complex<double>;
using vcpx = vector<cpx>;
void fft(vcpx &a, bool inv = false)
    int n = a.size(), j = 0; assert((n&-n) == n);
    for(int i=1; i<n; i++)</pre>
        int bit = (n >> 1);
        while(j >= bit)
             j -= bit;
             bit >>= 1;
        }
        j += bit;
        if(i < j) swap(a[i], a[j]);</pre>
    vcpx roots(n/2);
    prec c = 2 * pi * (inv ? -1 : 1);
    for(int i=0; i<n/2; i++)</pre>
        roots[i] = cpx(cosl(c * i / n), sinl(c * i / n));
    for(int i=2; i<=n; i<<=1)</pre>
        int step = n / i;
        for(int j=0; j<n; j+=i)</pre>
             for(int k=0; k<i/2; k++)</pre>
                 cpx u = a[j+k], v = a[j+k+i/2]*roots[step*k];
                 a[j+k] = u+v;
                 a[j+k+i/2] = u-v;
             }
        }
    7
    if(inv) for(int i=0; i<n; i++) a[i] /= n;
```

9 Graph

}

}

9.1 SCC - Tarjan Algorithm

```
Usage: scn[i]: SCC number of node i, nscc: the number of SCCs
vi adj[N];
int in[N], c = 0;
stack<int> p;
bool fin[N]; int scn[N], nscc = 0;
int dfs(int s)
{
    in[s] = ++c;
    p.push(s);
    int m = c;
    for(auto i : adj[s])
        if(in[i] == 0) m = min(m, dfs(i));
        else if(!fin[i]) m = min(m, in[i]);
    if(m == in[s])
        nscc++;
        while(p.top() != s)
            int i = p.top(); p.pop();
            scn[i] = nscc; fin[i] = true;
        p.pop();
        scn[s] = nscc; fin[s] = true;
    return m;
```

```
forr(i, n) if(!fin[i]) dfs(i);
```

9.2 Bipartite Matching - with DFS

Usage: Let's say that graph is bipartite. And Let's say that one group is A, and the other graph is B. |A| = N, |B| = M. matching(c = s): add one matching from $s \in A$. If successfully matched, return true; otherwise return false. selby[i] = store $s \in A$, s.t. $i \in B$ is matched with s.

```
(e.g.) forr(i, n) ans += matching(c=i);
   Time Complexity: O(VE)

vector<int> sideadj[N];
int selby[M];
int chk[M], c;
bool matching(int s)
{
    for(auto i : sideadj[s])
    {
        if(chk[i] == c) continue;
        chk[i] = c;

        if(selby[i] and !matching(selby[i])) continue;

        selby[i] = s;
        return true;
    }
    return false;
}
```

9.2.1 Minimum Vertex Cover on Bipartite Graph(Kőnig's Therorem)

On bipartite graph,

 $|\mathtt{Minimum\ Vertex\ Cover}| = |\mathtt{Maximum\ Matching}|$

To find Minimum Vertex Cover, (Should be added.)

${\bf 9.2.2}\quad {\bf Maximum\ Independent\ Set\ on\ Bipartite\ Graph}$

On bipartite graph,

 $|\mathtt{Maximum\ Independent\ Set}| = |V| - |\mathtt{Maximum\ Matching}|$

* Note: Complement of the Vertex Cover is the Independent Set.

9.2.3 Minimum Path Cover on DAG

Let's think about the bipartite graph, with vertex set A and B, satisfying follow property:

 If there's edge from node i to node j on DAG, then there's edge connecting ith node of A and jth node of B, and vice versa.

Then following holds:

|Minimum Path Cover of DAG| = |Maximum Matching on Bipartite Graph|

9.2.4 Maximum Antichain on DAG(Dilworth's Theorem)

On DAG,

|Minimum Path Cover| = |Maximum Antichain|
